Praktikum 6

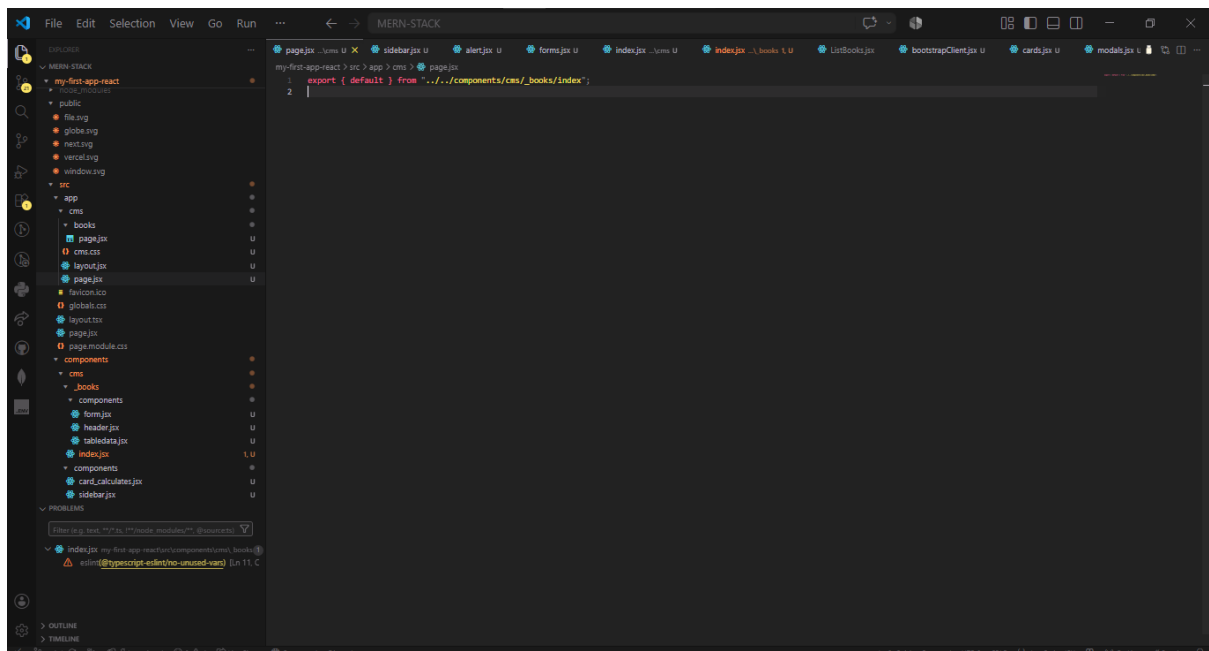

1. Persiapan dan Troubleshooting Error

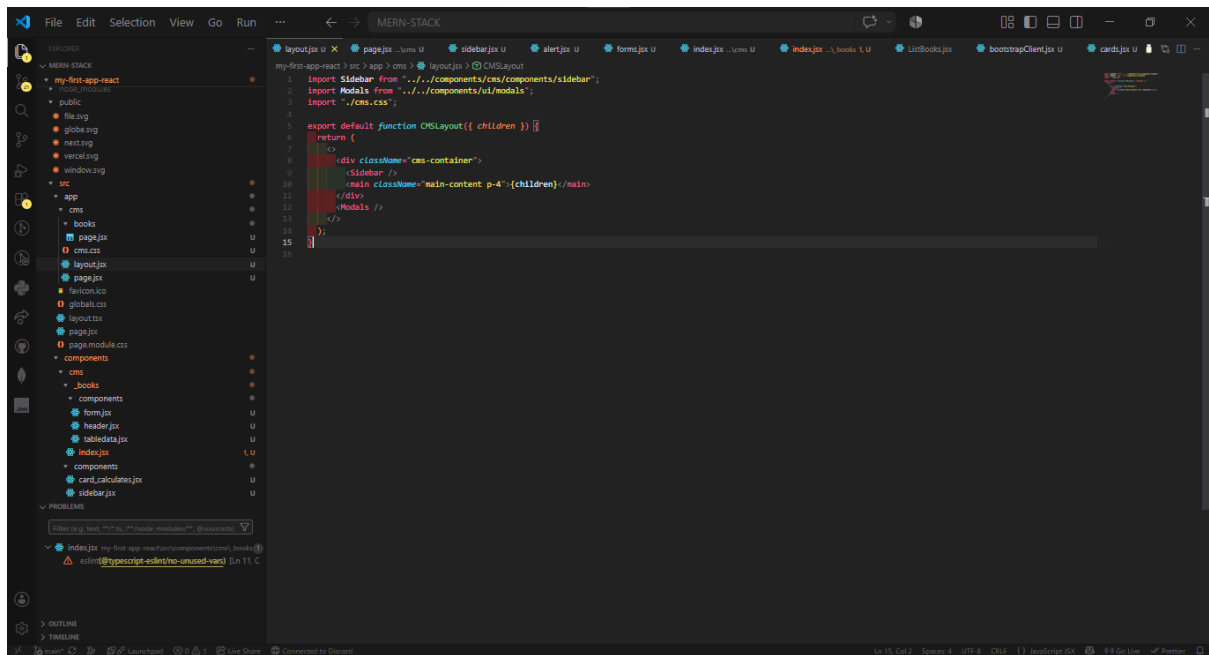

Pada tahap ini, dilakukan perbaikan pada beberapa file bawaan modul agar aplikasi dapat berjalan tanpa error dari linter (ESLint) maupun Next.js compiler.

a. Memperbaiki "Identifier 'React' has already been declared" pada datatables.jsx dengan menggabungkan import.

```
useEffect(() => {  
  if (total > 0 && itemsPerPage > 0)  
    // eslint-disable-next-line  
    setTotalPages(Math.ceil(total / itemsPerPage));  
  }, [total, itemsPerPage]);  
  
  return pages;  
  // eslint-disable-next-line  
}, [totalPages, currentPage, maxPageItems]);  
  
if (totalPages === 0) return null;
```

b. Mengatasi error "The default export is not a React Component" dengan menambahkan komponen default pada src/app/cms/page.jsx serta menambahkan import cms.css pada layout.jsx agar tampilan sidebar menjadi rapi sesuai desain.

2. Pembuatan Komponen Form (form.jsx)

Membuat file `form.jsx` di dalam direktori `_books/components/`. Komponen ini memanfaatkan reusable UI global seperti `TextInput`, `TextAreaInput`, `InputCheckbox`, dan `InputImage`. State management ditangani menggunakan `useState` untuk menampung inputan user.

```
"use client";
import React, { useState } from "react";
import {
  TextInput,
  TextareaInput,
  InputCheckbox,
  InputImage,
} from "@components/ui/forms";
import { Button } from "../../ui/button";

export default function BookForm({ onSubmit, onCancel }) {
  const [formData, setFormData] = useState({
    bookTitle: "",
    authorName: "",
    isFree: false,
    synopsis: "",
    story: "",
    coverImage: null,
    imagePreview: null,
  });

  const handleChange = (e) => {
    const { name, value, type, checked, files } = e.target;
    if (type === "file") {
      const file = files[0];
    }
  };
}
```

```

    setFormData((prev) => ({
      ...prev,
      coverImage: file,
      imagePreview: file ? URL.createObjectURL(file) : null,
    }));
  } else if (type === "checkbox") {
    setFormData((prev) => ({ ...prev, [name]: checked }));
  } else {
    setFormData((prev) => ({ ...prev, [name]: value }));
  }
};

const handleSubmit = (e) => {
  e.preventDefault();
  if (onSubmit) onSubmit(formData);
};

return (
  <form onSubmit={handleSubmit}>
    <p className="text-muted mb-4">Fill in the details for the new book.</p>
    <div className="row">
      <div className="col-md-5">
        <TextInput
          title="Book Title"
          name="bookTitle"
          value={formData.bookTitle}
          onChange={handleChange}
          required
        />
      </div>
      <div className="col-md-5">
        <TextInput
          title="Author Name"
          name="authorName"
          value={formData.authorName}
          onChange={handleChange}
          required
        />
      </div>
      <div className="col-md-2 d-flex align-items-center mt-4">
        <InputCheckbox
          title="Type Book"
          name="isFree"
          value="Is Free"
          checked={formData.isFree}
          onChange={handleChange}
          is_switch={true}
          required={false}
        />
      </div>
    </div>
  </form>
);

```

```

        />
      </div>
    </div>
    <div className="row">
      <div className="col-md-6">
        <TextAreaInput
          title="Synopsis"
          name="sinopsis"
          value={formData.sinopsis}
          onChange={handleChange}
          rows={3}
          required
        />
        <TextAreaInput
          title="Story"
          name="story"
          value={formData.story}
          onChange={handleChange}
          rows={4}
          required
        />
      </div>
      <div className="col-md-6">
        <InputImage
          title="Cover Image"
          name="coverImage"
          onChange={handleChange}
          imagePreview={formData.imagePreview}
          required
        />
      </div>
    </div>
    <div className="d-flex justify-content-center gap-3 mt-4 mb-2">
      <Button
        variant="light"
        type="button"
        onClick={onCancel}
        className="px-4 py-2"
      >
        <span className="fw-bold text-dark">Cancel</span>
      </Button>
      <Button variant="primary" type="submit" className="px-4 py-2">
        <span className="fw-bold">Submit Book</span>
      </Button>
    </div>
  </form>
);
}

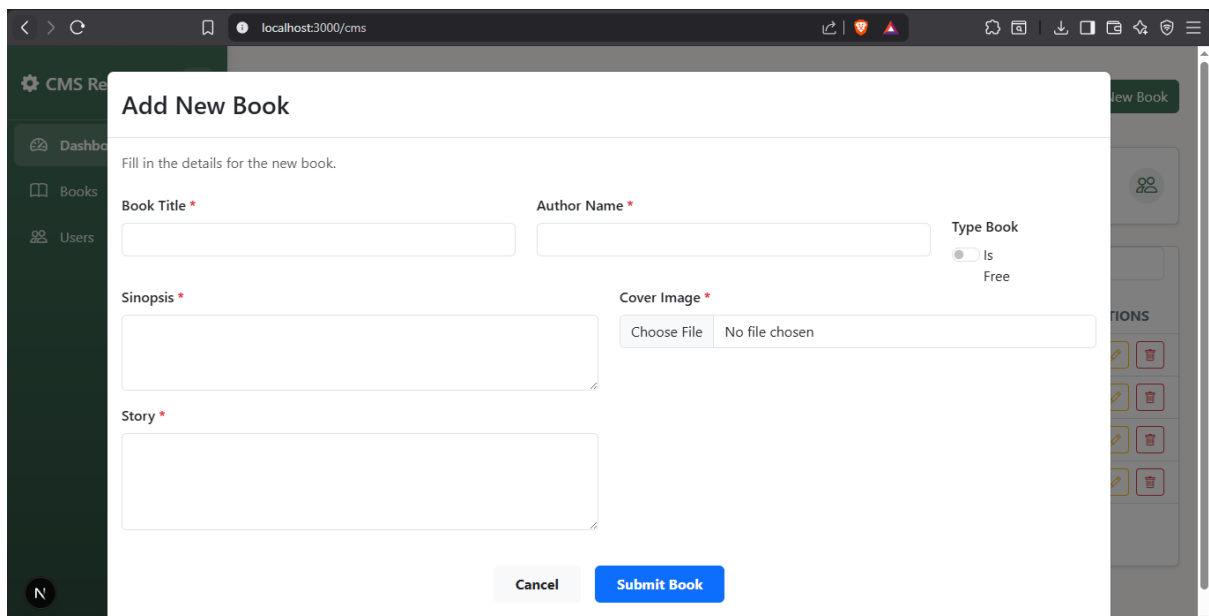

```

3. Integrasi Tombol "Add New Book" dengan Modal

Memodifikasi file index.jsx pada direktori _books untuk menghubungkan tombol "Add New Book" di komponen Header dengan Modals. Fungsi handleAddNewBook dibuat untuk memanggil openModal yang berisi komponen BookForm.

```
9
10 export function MBooks() {
11   const [books, setBooks] = useState(ListBooks); // 'setBooks' is assigned a value but never used.
12
13   const handleAddNewBook = () => {
14     openModal({
15       header: "Add New Book",
16       message: (
17         <BookForm
18           onSubmit={(data) => {
19             console.log("Data Buku Baru:", data);
20             alert("Buku berhasil ditambahkan!");
21             openModal({ open: false });
22           }}
23           onCancel={() => openModal({ open: false })}
24         />
25       ),
26       size: "xl",
27       closable: true,
28     });
29   };
30
31   return (
32     <div className="container-fluid">
```

Hasil akhir saat tombol diklik, aplikasi akan menampilkan Pop-up Modal yang memuat form pengisian data buku baru tanpa berpindah halaman (Single Page Application).

The screenshot shows a web browser at localhost:3000/cms. A modal titled "Add New Book" is open, displaying a form for adding a new book. The form includes the following fields and controls:

- Book Title ***: A text input field.
- Author Name ***: A text input field.
- Type Book**: A radio button group with options "Is" and "Free".
- Sinopsis ***: A text area for the synopsis.
- Cover Image ***: A file upload control with "Choose File" and "No file chosen" buttons.
- Story ***: A text area for the story.

At the bottom of the modal, there are two buttons: "Cancel" and "Submit Book". The background shows a CMS dashboard with a sidebar menu containing "Dashboard", "Books", and "Users".
